PASS (PROJECT ACCELERATION SOFTWARE SYSTEM)

"Power Your Drilling Plan!"

Advanced Design

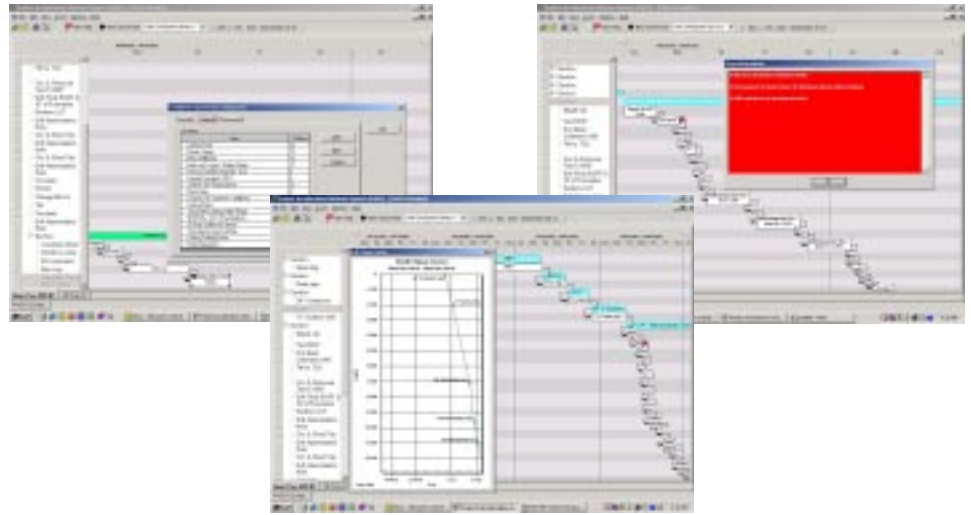

- Three tier client/server design consisting of a thin client, a database server and a high-end database, such as Microsoft SQL Server 7.0.
- Uses high-end database features, such as stored procedures, foreign key constraints, etc.
- Security is achieved both at the application level as well as the database level.
- Advanced error checking routines automatically email errors to the Bengal Development support team.

Flexibility

- Resources and task types are unique to business needs and are not limited to a predefined list.
- Create as many custom attributes as your company needs.
- Custom lookup tables allow the users to choose from a drop down list of custom attributes.
- An intuitive way to graphically view your data, the user interface allows specification of font type, size, color and style.
- Zoom in or out, from seconds to years, by dragging the mouse over the timeline.
- Features custom reporting by using Crystal Reports, complete with your own coding logic.
- Extensions may be written to extend the functionality of the system.

Efficiency

- Advanced timeline management allows the user to filter down to a specific time interval.
- Using the mouse, change the start time, stop time or duration of any task.
- Manipulate your plan simply by dragging the mouse.

The latest programming technology allows data to be compatible and versatile. Import and export data from just about anywhere.

Speed up the decision making process by viewing all of the custom tasks and resources laid out in a schedule that is easy to use and manage.

The level of customization is key to providing the ideal means to display exactly the kind of data and reports needed to get things done.

Repetitive tasks are automated and all available options to attack a problem are clear and visible.

Build your drilling plan graphically by activities and the resources that are attached to each activity. The **PASS** interface makes it easy to move actions around to optimize you resources. After drilling is completed, users in the office can run variances between the plan and what actually happened in the field.

PASS is completely customizable with your own data, so it provides ultimate accuracy when planning your drilling operation. The interface makes it easy to add your own lists, such as check lists, equipment lists and personnel lists, and associate them with tasks.

Once operations commence, field personnel use **PASS** to plan activities, capture actual task durations and capture "Learnings". Because reports for **PASS** are fully customizable, your personnel can review data in the way that will be most beneficial for your company.
