

AFE Management System
 PERC Morning Report Software
 PASS Project Acceleration Software
 RS Resource Scheduler Software

Advanced Design

- Three tier client/server design consisting of a thin client, a database server and a high-end database, such as Microsoft SQL Server 7.0.
- Uses high-end database features, such as stored procedures, foreign key constraints, etc.
- Security is achieved both at the application level as well as the database level.
- Advanced error checking routines automatically email errors to the Bengal Development support team.

Flexibility

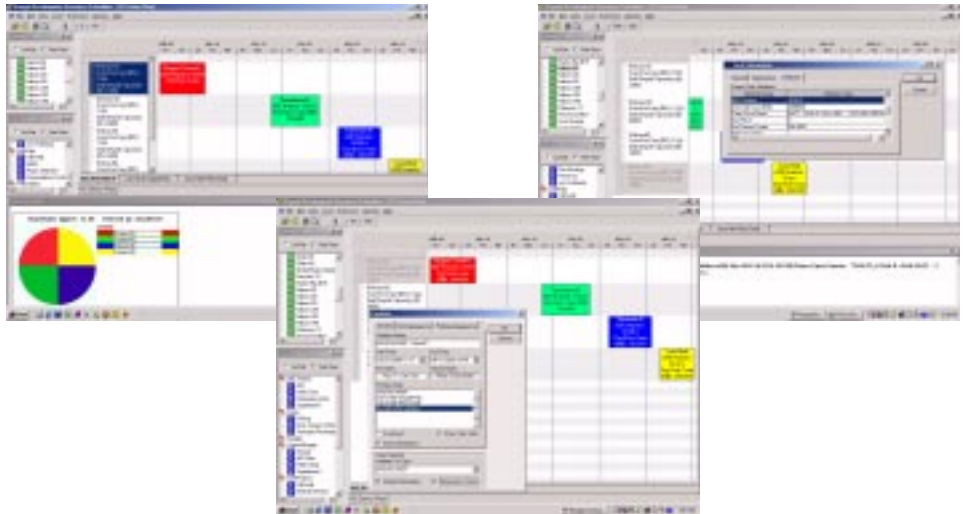

- Resources and task types are unique to business needs and are not limited to a predefined list.
- Create as many custom attributes as your company needs.
- Custom lookup tables allow the users to choose from a drop down list of custom attributes.
- An intuitive way to graphically view your data, the user interface allows specification of font type, size, color and style.
- Zoom in or out, from seconds to years, by dragging the mouse over the timeline.
- Features custom reporting by using Crystal Reports, complete with your own coding logic.
- Extensions may be written to extend the functionality of the system.

Efficiency

- Advanced timeline management allows the user to filter down to a specific time interval.
- Using the mouse, change the start time, stop time or duration of any task.
- Link tasks together, changing multiple tasks simply by dragging.

Resource Scheduler

“Get Your Schedule Under Control!”

The latest programming technology allows data to be compatible and versatile. Import and export data from just about anywhere.

Speed up the decision making process by viewing all of the custom tasks and resources laid out in a schedule that is easy to use and manage.

The level of customization is key to providing the ideal means to display exactly the kind of data and reports needed to get things done.

Repetitive tasks are automated and all available options to attack a problem are clear and visible.

Resource Scheduler allows users to schedule custom-built resources and tasks either manually or automatically through ties to an outside data source. At the heart of the system is an interface that allows users to graphically place resources and tasks onto their schedule. Users can link tasks, so when one task moves, the linked tasks move as well. Extensions help provide a level of customizability found in no other scheduling program.

Resource Scheduler was developed specifically with the oil industry in mind, but it can be used for scheduling any project. Users can create schedules of events with complex relationships, such as coordinating rig, boat and personnel schedules. But no matter how sophisticated the schedule, the graphical presentation is easy to read and understand.

Resource and task characteristics are completely customizable, allowing the schedule to supply the exact information your company needs to know for each particular task and resource in order to make scheduling decisions.
